Case No. RIM00025

In the Abstract:

Please delete the Abstract and replace with the following new Abstract:

A system and method for generating a screen element, based on a data object, of a component application is disclosed. The component application includes a data component having a data field definition and a screen component having a screen element definition. A mapping manager identifies a mapping present in the screen component. The mapping specifies dynamic relationships between the screen component and the data component by an identifier, and for selecting the data component mapped by the mapping according to the mapping identifier. The mapping manager maintains dynamic integrity and automatically synchronizes changes between the screen component and the corresponding data component. A data manager obtains a data object field value corresponding to the data field definition of the mapped data component; and a presentation manager generates a screen element from the screen element definition to include the data object field value.
